UIL COMPUTER SCIENCE WRITTEN TEST

2023 INVITATIONAL B

FEBRUARY/MARCH 2023

General Directions (Please read carefully!)

- 1. DO NOT OPEN THE EXAM UNTIL TOLD TO DO SO.
- 2. There are 40 questions on this contest exam. You will have 45 minutes to complete this contest.
- 3. All answers must be legibly written on the answer sheet provided. Indicate your answers in the appropriate blanks provided on the answer sheet. Clean erasures are necessary for accurate grading.
- 4. You may write on the test packet or any additional scratch paper provided by the contest director, but NOT on the answer sheet, which is reserved for answers only.
- 5. All questions have ONE and only ONE correct answer. There is a 2-point penalty for all incorrect answers.
- 6. Tests may not be turned in until 45 minutes have elapsed. If you finish the test before the end of the allotted time, remain at your seat and retain your test until told to do otherwise. You may use this time to check your answers.
- 7. If you are in the process of actually writing an answer when the signal to stop is given, you may finish writing that answer.
- 8. All provided code segments are intended to be syntactically correct, unless otherwise stated. You may also assume that any undefined variables are defined as used.
- 9. A reference to many commonly used Java classes is provided with the test, and you may use this reference sheet during the contest. AFTER THE CONTEST BEGINS, you may detach the reference sheet from the test booklet if you wish.
- 10. Assume that any necessary import statements for standard Java SE packages and classes (e.g., java.util, System, etc.) are included in any programs or code segments that refer to methods from these classes and packages.
- 11. NO CALCULATORS of any kind may be used during this contest.

Scoring

- 1. Correct answers will receive 6 points.
- 2. Incorrect answers will lose 2 points.
- 3. Unanswered questions will neither receive nor lose any points.
- 4. In the event of a tie, the student with the highest percentage of attempted questions correct shall win the tie.

STANDARD CLASSES AND INTERFACES – SUPPLEMENTAL REFERENCE

package java.lang class Object boolean equals(Object anotherObject) String toString() int hashCode() interface Comparable<T> int compareTo (T anotherObject) Returns a value < 0 if this is less than anotherObject. Returns a value = 0 if this is equal to anotherObject. Returns a value > 0 if this is greater than anotherObject. class Integer implements Comparable<Integer> Integer(int value) int intValue() boolean equals(Object anotherObject) String toString() String toString(int i, int radix) int **compareTo**(Integer anotherInteger) static int parseInt(String s) class Double implements Comparable<Double> **Double** (double value) double doubleValue() boolean equals(Object anotherObject) String toString() int compareTo (Double anotherDouble) static double parseDouble(String s) class String implements Comparable<String> int compareTo(String anotherString) boolean equals (Object anotherObject) int length() String **substring**(int begin) Returns substring (begin, length()). String substring (int begin, int end) Returns the substring from index begin through index (end - 1). int indexOf (String str) Returns the index within this string of the first occurrence of str. Returns -1 if str is not found. int indexOf(String str, int fromIndex) Returns the index within this string of the first occurrence of str, starting the search at fromIndex. Returns -1 if str is not found. int indexOf(int ch) int indexOf(int ch, int fromIndex) char **charAt**(int index) String toLowerCase() String toUpperCase() String[] split(String regex) boolean matches (String regex) String **replaceAll**(String regex, String str) class Character static boolean isDigit(char ch) static boolean isletter(char ch) static boolean isLetterOrDigit (char ch) static boolean isLowerCase (char ch) static boolean isUpperCase (char ch) static char toUpperCase(char ch) static char toLowerCase (char ch) class Math static int **abs**(int a) static double **abs**(double a) static double pow(double base, double exponent) static double sqrt(double a) static double ceil (double a) static double **floor**(double a) static double min(double a, double b) static double **max**(double a, double b) static int min(int a, int b) static int **max**(int a, int b) static long round (double a) static double random() Returns a double greater than or equal to 0.0 and less than 1.0.

```
package java.util
interface List<E>
class ArrayList<E> implements List<E>
  boolean add(E item)

<pre>Interface Predicate<t> boolean test(T t)</t></pre>
Interface Supplier <t> T get()</t>

UIL COMPUTER SCIENCE WRITTEN TEST – 2023 INVITATIONAL B

Note: Correct responses are based on Java SE Development Kit 17 (JDK 17) from Oracle, Inc. All provided code segments are intended to be syntactically correct, unless otherwise stated (e.g., "error" is an answer choice) and any necessary Java SE 17 Standard Packages have been imported. Ignore any typographical errors and assume any undefined variables are defined as used. For all output statements, assume that the System class has been statically imported using: import static java.lang.System.*;

A) 1410 ₁₆	B) DA ₁₆	C) 13A ₁₆	D) 19A ₁₆	E) 1310 ₁₆
Question 2				
What is the output of	the code segment to the	right?	out.print(1 + 29	% 10 / 4 + 3);
A) 3 B) 4	C) 5 D) 6	E) 6.25		
Question 3				
•	the code segment to the	right?		
A)Blue Red				
Ked GreenYellow				
PurpleOrange				
1 5				
B) Blue				
Red				
Green Yellow			out.print("Blue\r	nRed\nGreen");
PurpleOrange			out.print("Yellow	
			out.print("Orange	e");
C) Blue				
Red				
Green YellowPurple				
Orange				
D) BlueRed	1			
GreenYellowP	urpleOrange			
E) Blue				
Red				
GreenYellowP	urple			
Orange Question 4				
	the code correct to the	right)	String str = "Sch	nolastic":
-	the code segment to the	-	out.print(str.ind	
A) 1 B) 2	C) 7 D) 8	E) 9		
Question 5				
What is the output of	the code segment to the	right?	boolean A = true;	
A) true			boolean $B = !A;$	
B) false			out.print(!A && ((A B) ^ B);
Question 6				
	the code segment to the	right?	double M = Math.s	qrt(31);
-	-	-	out.print((int)Ma	ath.floor(M));
A) 5 B) 5.0	C) 6 D) 6.	0 E) 15		

Question 7 What is the output of the code segment to the right? A) 6.4 B) 3.2 C) 6.2 D) 6.0 E) 6 Question 8 What is the output of the code segment to the right? A) B B) BCDEF C) BCDEFG D) F E) FG	<pre>double T = 2.2; double A = 8 * 4 / 10 + 1 + T ; out.print(A); int Q = 20 % 7; switch (Q) { case 1:out.print("A"); case 2:out.print("B"); case 3:out.print("C"); case 4:out.print("C"); case 5:out.print("E"); case 6:out.print("F"); default:out.print("G"); } </pre>
Question 9 How many x's will be output of the code segment to the right? A) 4 B) 5 C) 6 D) 7 E) 12	<pre>for(int x = 50; x > 2; x = x / 2 + 1) out.print("x");</pre>
Question 10 What is the output of the code segment to the right? A) 49 B) 45 C) 41 D) 40 E) 36	<pre>int[] four = {4,8,12,16,20,24,28}; int[] five = {5,10,15,20,25,30,35}; if (four.length<five.length) out.print(four[4]+five[5]); else out.print(four[5]+five[4]);</five.length) </pre>
Question 11 What is output by the code segment to the right? A) 3684 B) 12243648 C) 361224 D) 363648 E) 3636	<pre>String St = "12 24 36 48"; Scanner go = new Scanner(St); out.print(go.nextInt() + go.nextInt()); out.print(go.next() + go.next());</pre>
Question 12 What is the output of the code segment to the right? A) 113 B) 123 C) 73 D) 197 E) 63	<pre>int sum = 0; for(int x = 1; x <= 50; x = x * 2) sum += x + 10; out.print(sum);</pre>
Question 13 What is the output of the code segment to the right? A) 11 B) 12 C) 13 D) 14 E) 15	int a = 15, b = 12, c = 9 ; out.print(c ^ b a - c & b ^ a);
Question 14What is the output of the code segment shown on the right?A)0B)1C)-1D)127E)-129	out.println(Byte.MIN_VALUE + 127);

Question 15	ArrayList <integer> messi;</integer>
Question 15 What is output by the code segment to the right? A) [12, 10, 14, 16, 10] B) [10, 12, 10, 14, 16, 10] C) [12, 12, 14, 16, 10] D) [10, 12, 12, 14, 16, 10] E) [10, 12, 14, 16, 10]	<pre>messi = new ArrayList<integer>(); messi.add(10); messi.add(12); messi.add(messi.get(1)); messi.add(14); messi.remove(0); messi.add(16); messi.add(10); messi.add(0,messi.get(0)-2);</integer></pre>
Question 16	<pre>out.println(messi);</pre>
What is the output of the code segment shown on the right? A) GJ B) IJ C) JB D) DE E) ED	<pre>String D = "ABCDEFGHIJ"; for(int x=1; x<=4; x++) D = D.substring(3)+D.substring(0,1); out.println(D);</pre>
Question 17 What is the output of the code segment shown on the right? A) 169 B) 144 C) 121 D) 100 E) 81	<pre>ArrayList<integer>T; T = new ArrayList<integer>(); T.add(3); T.add(5); for (int x=2;x<=100;x++) { int N = T.get(x-2) + T.get(x-1); T.add(N); } out.print(T.get(8));</integer></integer></pre>
Question 18What is the output of the code segment shown on the right?A) 3B) 6C) 9D) 12E) 14	<pre>String St = ""; for(char ch = 'A'; ch<='C'; ch++) St += ch + St + ch; out.print(St.length());</pre>
Question 19 What is the output of the code segment shown on the right? A) 3 B) 4 C) 5 D) 6 E) 7	<pre>int[] G = {5,1,2,9,2,6,7,4,1,7}; for(int x=1; x<=8; x++) G[x] = (G[x-1] + G[x+1])/2; out.println(G[5]);</pre>

Question 20				
In the code segmen	t to the right,wh	nat is the outpu	t of line 1?	
A) 0 B)	1 C) 2	D) 3	E) 4	
Question 21				int[]cool = {17,19,12,8,3};
In the code segmen	t to the right,wh	at is the outpu	t of line 2?	<pre>int[]list = new int[cool.length]; for (int = 0; or (</pre>
A) 0 B)	1 C) 2	D) 3	E) 4	<pre>for(int x=0;x<cool.length;x++) for(int="" y="x+1;y<cool.length;y++)</pre"></cool.length;x++)></pre>
Question 22 In the code segment to the right, if the first line: int[]cool = {17,19,12,8,3} was changed to int[]cool = {17,19,12,8,3,1,22,11,5,6} What would be the final value of list[0]? A) 1 B) 3 C) 5				<pre>if(cool[x]>=cool[y]) list[x]++; else list[y]++; out.print(list[0]); //line 1 out.print(list[4]); //line 2</pre>
 D) 7 E) 9 Question 23 What is the output of A) CAB B) B. 	_		he right? E) 198	<pre>String St = "CAB"; int N = St.charAt(2); N += St.charAt(1); N += St.charAt(0); out.print(N);</pre>
Question 24 In the code on the ri A) 770 B) 28 C) 800 D) 700 E) 880	ght, how many *	s will be printed	d?	<pre>for(int A = 1; A <= 10; A++) for(int B = -5; B <= 5; B++) for(int C = 8; C > 1; C) out.print("*");</pre>
Question 25				
What is returned by	the method call	Yes(5,2))	
A) 2 B)	5 C) 7	D) 10	E) 6	public static int Yes(int x, int y)
Question 26 What is returned by A) 9 B) Question 27 What is returned by	24 C) 6	D) 12 Yes(0,7)	E) 18	<pre>{ if (x>y) return x * y; if (x == y) return Yes(x+y,y+1); else return Yes(x+1,y-1) + 2; }</pre>
A) 20 B)	24 C) 26	D) 28	E) 30	}

Question 28	
In the code to the right, what is output on line #1? A) 10 B) 12 C) 14 D) 16 E) 18	<pre>TreeMap<character,integer> Cup; Cup = new TreeMap<character,integer>();</character,integer></character,integer></pre>
Question 29 In the code to the right, what is output on line #2? A) 10 B) 12 C) 14 D) 16 E) 18 Question 30 In the code to the right, what is output on line #3? A) [16, 18] B) [18, 12] C) [12, 16] D) [18, 14] E) [18, 16]	<pre>Stack<integer> Bowl; Bowl = new Stack<integer>(); Cup.put('D',18); Cup.put('A',12); Cup.put('C',14); Cup.put('C',14); Cup.put('C',16); Cup.put('C',16); char x; for(x='D';x>='A';x) Bowl.push(Cup.get(x)); out.println(Bowl.pop()); // Line 1 Bowl.pop(); out.println(Cup.get('C'));// Line 2 out.println(Bowl); // Line 3</integer></integer></pre>
Question 31 What is the output of the code segment shown on the right? A) false false B) false true C) true false D) true true E) no output - there is a compile error	<pre>boolean A = false; boolean B = true; for (int x = 1; x<=12; x++) if(x*x%2==0) A = B; else B = !B; out.println(A + " " + B);</pre>

Question 32	
In the code to the right, what is output by line #1?	
A) 5	
B) 6	public class Soccer
C) 12	{
D) 14	private int A;
E) 16	private int B; private int C;
Question 33	
In the code to the right, what is output by line #2?	<pre>public Soccer(int x, int y, int z)</pre>
A) 12	{
B) 24	A = x;
C) 28	B = y;
D) 36	C = z;
E) 42	}
Question 34	public Soccer(int x, int y)
In the code to the right, what is output by line #3?	{
A) 20	this(y, x, x+y);
B) 40	}
C) 54	
D) 60	public Soccer(int x)
E) 72	<pre>{ this(x, 2*x);</pre>
	}
	<pre>public Soccer()</pre>
	{
	this(10);
	}
	<pre>public int primetime()</pre>
	{
	return A+B+C;
	}
	}
	//client code
	Soccer $R = new Soccer(1, 2, 3);$
	<pre>out.println(R.primetime()); // #1</pre>
	Soccer S = new Soccer(4,8);
	<pre>out.println(S.primetime()); // #2</pre>
	Soccer T = new Soccer();
	<pre>out.println(T.primetime()); // #3</pre>

Question 35	
What is the output of the code segment shown on the right?	int $B = 127;$
A) 0 B) 1 C) 7 D) 17 E) 64	B = B >> 5; B = B << 4;
	B = B + 8;
	B = B >> 3;
	out.println(B);
Question 36	
What is the output of the code segment shown on the right?	<pre>String St = "UNIVERSITY"; int I = St indexOf("II");</pre>
A) UNI B) NIV C) NI D) SIT E) SI	<pre>int L = St.indexOf("I"); out.print(St.substring(L-1,L+1));</pre>
Question 37	
What is the output of the code segment shown on the right?	int[]Pogo = {22,33,11,66,44};
A) 44 66 11 33 22	int $x = 10;$ int $y = 4;$
B) 44 44 44 44 44	for $(x = 0; x \le 4; x++)$
C) 22 22 22 22 22	
D) 22 33 11 66 44	Pogo[x]=Pogo[y];
E) 44 66 11 66 44	Pogo[y]=Pogo[x];
	y;
	}
	for(int i = 0; i<=4; i++)
	out.print(Pogo[i]+" ");
Question 38	int $A = 50;$
What is the output of the code segment shown on the right?	int $B = 65;$
A) 5 B) 50 C) 65 D) 500 E) 650	int $F = -1;$
	for (int x=1; x<=A; x++)
	if(A%x==0 && B%x==0)
	F = x;
	out.print(A * B / F);
Question 39 Evaluate the prefix expression to the right. Write your answer in	
the answer blank for #39.	+ * / - 90 20 10 3 7
	, , , , , , , , , , , , , , , , , , , ,
Question 40 To the right, we have begun to list all the 6-digit binary numbers	
from 000000 to 111111. So far, we have listed only 8 of them. If	000000, 000001, 000010, 000011
we were to list all 64 of these 6-digit binary numbers, how many	000100, 000101, 000110, 000111
"ones" would be written? So far, we have written 12 "ones"

* See "Explanation" section below for alternate, acceptable answers.

Note: Correct responses are based on Java SE Development Kit 17 (JDK 17) from Oracle, Inc. All provided code segments are intended to be syntactically correct, unless otherwise stated (e.g., "error" is an answer choice) and any necessary Java SE 17 Standard Packages have been imported. Ignore any typographical errors and assume any undefined variables are defined as used.

Explanations:

1.	С	Convert all to Base 16 and then add. $10010111_2 = 97_{16}$
		$10100011_2 = A3_{16}$
		7 + 3 = 10 which would be an A
		9 + A (10) = 19 which is 13 (3 carry the 1)
		$97_{16} + A3_{16} = 13A_{16}$
0	D	
2.	D	Use order of operations. Perform integer modulus first.
		1 + 29 % 10 / 4 + 3
		1+9/4+3
		Next do integer division.
		1 + 2 + 3
		Now add left to right. 1 + 2 + 3 = 6
3.	A	Since there are only print statements, new lines will only be invoked at the \n new line escape
0.		character. So new lines will occur after Blue, Red, and Yellow
4.	E	str.indexOf("c",2)
		This will find the position of "c" if you start looking at position 2. Therefore it "misses" the first
<i>_</i>		"c" and finds the "c" in position 9
5.	В	A is true. B is "not A" meaning B is false. Now.
		!A && (A B) ^ B
		First, substitute all the values
		!true && (true false) ^ false
		Next, evaluate !true
		false && (true false) ^ false
		Now, do the parenthesis
		false && true ^ false
		Next is "xor"
		false && true
		Using and
		false is the final answer
6.	A	Math.sqrt(31) returns a value greater than 5.0 but less than 6.0
		Math.floor() will round that value down to 5.0 (int) type casts that value as an integer 5
7.	С	Even though A is a double, the evaluation begins with integer operations.
1.		8*4 is 32, then 32/10 is 3 using integer division.
		Next add 1 (another integer) to get 4 before a double is finally introduced giving us 6.2
8.	E	20 % 7 is 6
		So case "6" is invoked.
		Because there are no break statements, the output will begin with F and keep doing all the inputs through the end of the switch statement.
9.	С	x = x/2 + 1
		The values of x in the iterations would be:
		50 26 14 8 5 3 then the value 2 would stop the process, but not print a 7th x.
10.	A	The two arrays are the same length, so the else is invoked.
		Remember the first element in an array has an index of 0.
		four[5] is 24 five[4] is 25
		The sum is 49

11.	D	St = "12 24 36 48";
	D	The Scanner go accesses the String St.
		The first two go.nextInt() calls treat the inputs as integers and thus adds 12 + 24 to get 36
		The next two go.next() calls treat the inputs as Strings and thus adds "36"+"48" = "3648"
	_	So, we get 363648 as the output
12.	В	The loop itself runs through the values 1 2 4 8 16 32.
		The accumulator adds these values one by one. That gets a total of 63
		But with every iteration, 10 more is added, for a total of 60.
		The output is $63 + 60 = 123$
13.	E	a = 15, b = 12, c = 9;
		a=1111 b=1100 c=1010
		c^b a-c&b^a
		9 ^ 12 15 - 9 & 12 ^ 15
		9 ^ 12 15 - 9 & 12 ^ 15 (first, subtract)
		9 ^ 12 6 & 12 ^ 15 (now it is bit-wise time)
		1001 ^ 1100 0110 & 1100 ^ 1111
		1001 ^ 1100 0110 & 1100 ^ 1111 (do and)
		1001 ^ 1100 0100 ^ 1111
		1001 ^ 1100 0100 ^ 1111 (do leftmost xor)
		0101 0100 ^ 1111
		0101 0100 ^ 1111 (do other xor)
		0101 1011 (finish with the or)
		1111 = 15
14.	С	Byte values range from -128 to 127
	Ū	Byte_MIN_VALUE = -128
		-128 + 127 = -1
15.	D	Here is the progression of messi.
		[]
		[10] [10,12]
		[10,12,12]
		[10,12,12,14]
		[12,12,14]
		[12,12,14,16]
		[12,12,14,16,10] [10,12,12,14,16,10]
16.	A	In each iteration, the string loses the first three letters, but that first letter is saved as it moves to
		the end.
		There are 4 iterations.
		(0) ABCDEFGHIJ
		(1) DEFGHIJA
		(2) GHIJAD (3) JADG
		(4) GJ
17.	В	This is a Fibonacci algorithm starting with a 3 and a 5.
		Each new element is the sum of the previous two elements.
		3 5 8 13 21 34 55 89 144 233 377
18.	E	The code prints element #8
10.		The loop iterates 3 times. For A, B, then C. A: St becomes "AA"
		B: St becomes AABAAB
		C: St becomes AABAABCAABAABC
		The length is 14

19.	D	[5,1,2,9,2,6,7,4,1,7] = original array
		Loop goes from 1 to 8. Watch the array change.
		1 - [5,3,2,9,2,6,7,4,1,7]
		2 - [5,3,6,9,2,6,7,4,1,7]
		3 - [5,3,6,4,2,6,7,4,1,7]
		4 - [5,3,6,4,5,6,7,4,1,7]
		5 - [5,3,6,4,5,6,7,4,1,7]
		6 - [5,3,6,4,5,6,5,4,1,7]
		7 - [5,3,6,4,5,6,5,3,1,7]
		8 - [5,3,6,4,5,6,5,3,5,7]
		Element #5 is a 6
20.	D	This is a portion of a sort routine called the "flag-tag" or "Supreme Court" sort.
		The elements in the list array represent the indices of the where each corresponding cool item
		should be in a sorted array.
	_	17 is greater than 3 other values in the cool: 12, 8, and 3
21.	A	3 is greater than 0 other values in cool
22.	D	17 is larger than 7 items 12,8,3,1,11,5,6
23.	E	This adds the ASCII codes of 'A', 'B', and 'C'
		It is nice to know that the ASCII Code for 'A" is 65 and 'a' is 97.
		Here we add 65+66+67 = 198
24.	A	The A loop iterates 10 times.
		For each iteration of the A loop, the B loop iterates 11 times.
		For each iteration of the B loop, the C loop iterates 7 times.
		10 * 11 * 7 = 770
25.	D	Yes(5,2) goes straight to the stopping state condition.
		5 * 2 = 10
26.	В	Yes (3,3) first goes to the middle option.
		Yes(3,3) = Yes(6,4)
		Yes(6,4) = 24
27.	A	Yes(0,7) = Yes(1,6) + 2
		Yes(1,6) = Yes(2,5) + 2
		Yes(2,5) = Yes(3,4) + 2
		Yes(3,4) = Yes(4,3) + 2
		Yes(4,3) = 12
		12 + 2 + 2 + 2 + 2 = 20
28.	В	After the 5 Cup.put() lines, we have:
		A = 12 $ B = 10$ $ C = 16$ $ D = 18$
		These are pushed onto the Bowl stack in reverse order with 18 being on the bottom.
		At this point the stack is [18,16,10,12]
20	D	The first pop removes the 12
29.	U	Continuing from #28
20	E	Cup.get('C') gives us 16 Continuing from #28
30.	E	0
		Cup is now [18,16,10]
		10 is popped.
		Cup is now [18,16]

31. D The loop will test the numbers 1,4,9,16,25,36,49,64,81,100,121,144 Notice that the alternate from odd to even A = false, B=true. If even, A takes on B's value If even, A takes on B's value I odd, B's value flips 1 odd 1 odd - now B=false 4 even - now A=false 9 odd - now B=false 36 even - now A=false 36 even - now A=false 36 even - now A=false 100 even - now A=false 100 even - now A=false 101 od - now B=false 100 even - now A=false 101 even - now A=false 100 even - now A=false 102 oven - now A=false 121 odd - now B=false 103 even - now A=false 121 odd - now B=false 121 odd - now B=false 121 odd - now B=false 122 even - now A=false 121 odd - now B=false 133. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since	36.	С	
 37. E The original values are [22,33,11,66,44] The loop iterates 5 times. Pogo[0] becomes Pogo[4] [44,33,11,66,44] The next line has no effect Pogo[4] = Pogo[0] since they are already equal. The second iteration makes Pogo[1] = Pogo[3] [22,66,11,66,44] Again the next line has no effect. In fact, no other changes are made because: Pogo[2] = Pogo[2] causes no change. Pogo[3] = Pogo[1] causes no change. Pogo[4] = Pogo[0] causes no change. 38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since 			
The loop iterates 5 times. Pogo[0] becomes Pogo[4] [44,33,11,66,44] The next line has no effect Pogo[4] = Pogo[0] since they are already equal. The second iteration makes Pogo[1] = Pogo[3] [22,66,11,66,44] Again the next line has no effect. In fact, no other changes are made because: Pogo[2] = Pogo[2] causes no change. Pogo[3] = Pogo[1] causes no change. Pogo[4] = Pogo[0] causes no change. Pogo[4] = Pogo[0] causes no change. 38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since			
Pogo[0] becomes Pogo[4][44,33,11,66,44]The next line has no effect Pogo[4] = Pogo[0] since they are already equal.The second iteration makes Pogo[1] = Pogo[3][22,66,11,66,44]Again the next line has no effect.In fact, no other changes are made because:Pogo[2] = Pogo[2] causes no change.Pogo[3] = Pogo[1] causes no change.Pogo[4] = Pogo[0] causes no change.Pogo[4] = Pogo[0] causes no change.S8.EThe loop is designed to find the greatest common factor of 50 and 65Thus F = 5Now doing 50 * 65 / 5 you get 650This is a good way to get the least common multiple since	37.	E	
38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 Thus F = 5 Now doing 50 * 65 / 5 you get the least common multiple since			
38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 Thus F = 5 Now doing 50 * 65 / 5 you get the least common multiple since			
38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since 122,66,11,66,44]			
Again the next line has no effect. In fact, no other changes are made because: Pogo[2] = Pogo[2] causes no change. Pogo[3] = Pogo[1] causes no change. Pogo[4] = Pogo[0] causes no change. 38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since			
In fact, no other changes are made because: Pogo[2] = Pogo[2] causes no change. Pogo[3] = Pogo[1] causes no change. Pogo[4] = Pogo[0] causes no change. 38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since			
Begin Pogo[2] = Pogo[2] causes no change. Pogo[3] = Pogo[1] causes no change. Pogo[4] = Pogo[0] causes no change. 38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since			
Pogo[3] = Pogo[1] causes no change. Pogo[4] = Pogo[0] causes no change. 38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since			
Pogo[4] = Pogo[0] causes no change. 38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since			
38. E The loop is designed to find the greatest common factor of 50 and 65 Thus F = 5 Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since			
Thus $F = 5$ Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since	38	F	
Now doing 50 * 65 / 5 you get 650 This is a good way to get the least common multiple since	50.	L.	
This is a good way to get the least common multiple since			
$A \cap B = GCF(A,B) \cap LCM(A,B)$			
			$A D = GUF(A, B) \cap LUIVI(A, B)$

39.	28	+ * / - 90 20 10 3 7 + * / 70 10 3 7 + * / 70 10 3 7 + * 7 3 7 + 21 7 28
40.	192	If we listed all 64 binary numbers from 000000 to 111111, we would be listing 384 digits (64*6). If it is a complete list, there would be half zeros and half ones. Thus, we would have 192 of each.
